RP689 – Patient Drape

This versatile patient drape is a must in radiology practice. It provides targeted protection for your patients, combined with uncomplicated handling.

You can choose the format freely, depending on your intended use. Additional equipment with hook-and-loop straps or an individual cut according to your ideas are also possible at any time.

Effective radiation protection for your patients concerns the areas of the body adjacent to the diagnostic field; so in most cases you should rather have a stock of several, somewhat smaller drapes, which you can, of course, also use in combination.

- **Protective Material** Standard lead
- **Lead Equivalent** optionally in 0.50 mmPb or 1.00 mmPb
- **Outer Cover/Colour** ComforTex® HPMF, ComforTex® HPMF Plus (designs only), available in the colours: Titan, Blue Admiral, Regatta, Curacao, Lagoon, Mandarin, Orchidee, Baccara, or designs: Happy, Nautilus
- **Dimensions** Our standard material widths are 60 and 90 cm, and you determine the length. Of course, you can also define a cut that deviates from the standard widths of 60 and 90 cm.
- **Edging** All edges covered with seam band

**TIPP** Don’t be too “well-meaning” when choosing the size of your patient drape. Bear in mind that the drape also has to be moved by you and the size is directly related to the weight.

**Modell:** RP689 Patient Drape (Standard lead)
